Kisaan.ai

ALIBABA CLOUD AI HACKATHON PAKISTAN 2026

Project Improvement

A clear team update on what has improved, what works today, and how we should present the product.

Team Briefing Document

31 August 2026

EXECUTIVE SUMMARY

We now have a real AI Crop Doctor

Kisaan.ai has moved beyond a visual demonstration. A farmer can now upload a real crop photograph, choose the crop, receive an assessment from Alibaba Cloud AI, hear safe advice, and keep a history of previous checks.

Live AI

Real images are assessed using Alibaba Cloud's Qwen3-VL vision model.

Safety first

The system can refuse to guess when the photograph does not provide enough evidence.

Farmer friendly

Simple crop selection, image preview, spoken advice, and clear next steps.

Evidence ready

Each result records the model and a unique request number for demonstration.

> **The most important improvement**
>
> The Crop Doctor is now a genuine working product journey rather than a fixed animation with a pre-written result.

HOW IT WORKS

A simple farmer journey

1 **Choose crop** → 2 **Upload photo** → 3 **Receive guidance**

The farmer selects Cotton, Wheat, Rice, Maize, Sugarcane, Apple, Apricot, or "Not sure." The photograph is checked and sent securely for visual assessment. Kisaan then provides an explanation and safe next actions.

COMPLETED IMPROVEMENTS

What is working now

1

Real photograph assessment

Farmers can upload a crop image from their device or use the phone camera where supported.

2

Alibaba Cloud AI connection

The product successfully connects to Qwen3-VL and receives a live response. Authentication and model access have been confirmed.

3

Honest uncertainty

If the plant or disease cannot be identified safely, Kisaan says so. It does not invent a diagnosis or encourage unnecessary treatment.

4

Safe agricultural guidance

The AI is instructed not to prescribe pesticides, chemicals, or dosages. It recommends inspection and expert confirmation when necessary.

5

Clearer answers

Responses are cleaned to prevent mixed-language words, missing spaces, confusing number ranges, and unnecessarily long text.

6

Spoken advice

Farmers can press “Hear advice” to listen to the assessment and next steps.

7

Diagnosis history

The most recent assessments are saved on the farmer’s device with a small photograph, date, crop, result, and status.

8

Protection and reliability

Incorrect file types, oversized images, disguised files, and excessive requests are blocked to protect users and available AI credits.

HONEST PRODUCT STATUS

What is live and what is still a preview

Working today

- Real crop-image upload
- Crop selection
- Alibaba Cloud visual assessment
- Safe uncertain results
- Farmer-friendly next steps
- Spoken result playback
- Recent diagnosis history
- Image and usage protection

Still demonstration data

- Satellite field monitoring
- NDVI field-health calculations
- Live weather forecasts
- Flood-risk monitoring
- Crop-planning recommendations
- Urdu and Sindhi speech recognition
- Farmer accounts and cloud records
- Offline synchronization

> **Important for the presentation**
> We should call the working Crop Doctor "live." Weather, satellite, crop planning, and other unfinished sections should be called "product previews" or "next-phase modules."

RESPONSIBLE WORDING

What the team should say

AI-assisted visual assessment | Early screening | Safe next steps | Human confirmation | Not calibrated yet

Avoid saying: "Kisaan guarantees the disease," "the result is always accurate," or "farmers can spray based only on this answer."

Say instead: "Kisaan provides early visual guidance, explains uncertainty, and recommends expert confirmation before treatment."

TEAM DEMONSTRATION

Recommended three-minute flow

1. **Introduce the problem.**
   Many farmers cannot access timely, understandable, and independent crop advice.

2. **Open Crop Doctor.**
   Explain that this is the first fully working Kisaan.ai feature.

3. **Select the crop.**
   Use “Not sure” to demonstrate that Kisaan does not require the farmer to know everything in advance.

4. **Upload a clear crop image.**
   Show the real photograph preview before analysis.

5. **Run the live assessment.**
   Point out the explanation, uncertainty message, safe next steps, model name, and request number.

6. **Play the advice.**
   Use “Hear advice” to reinforce the voice-first vision.

7. **Show history.**
   Explain that the farmer can review previous assessments on the same device.

8. **Close honestly.**
   Describe weather, satellite monitoring, and crop planning as the next connected modules.

NEXT PRIORITIES

What the team should do next

1. ## Evaluate with real labeled images

   Test healthy, diseased, unclear, wrong-plant, and non-crop photographs. Record correct, incorrect, and safely rejected results.

2

Add preview labels

Clearly mark unfinished weather, satellite, and crop-planning information as demonstration data.

3

Deploy the product

Prepare one stable online link for judges and keep the Alibaba Cloud credential private.

4

Prepare evidence

Create a test-results table, safety statement, product diagram, and backup demonstration recording.

TEAM MESSAGE

Our strongest story

Kisaan.ai is building a voice-first farming companion for Pakistan. Its first working feature—the AI Crop Doctor—now accepts real farmer images, uses Alibaba Cloud AI, communicates uncertainty honestly, and provides safe next steps. We should demonstrate this complete journey confidently while remaining transparent about the modules still under development.
